Subject: RE: Site Priority Characterization form for Safety Light Corporation

Hello Kevin,

I am not sure whether the wells used for Level I actual contamination are currently used for drinking water. However, the wells were used for drinking water at the time of sampling. The wholesale nursery located east of the residences is now served by municipal water supplied by Bloomsburg Water Department (United Water Bloomsburg). The owner of the nursery did not know whether the residences on Old Berwick Road are served by the water department. However, Bloomsburg is west of Safety Light and the nursery is east of Safety Light. The nursery is also farther east of Safety Light than the residences. Therefore, there is a good possibility that those residences are now served by municipal water.

The Site Priority Characterization form that you completed looks good. Under Number 2, it is possible that was some flooding during the 1996 floods; however, I could not find documentation that the site actually flooded. Information about the Susquehanna River flood of 1996 focused on the Harrisburg area.

Sandra

(PA DEP)

As noted in my e-mail of Oct. 31, EPA HQ is initiating a new process to prioritize those sites which the EPA regions wish to propose to the NPL. The first National Priority Panel meeting will be held in Washington, DC on Nov. 19-20. A total of 34 sites will be discussed, including four from R3.

In preparation for this meeting, we have been asked to complete a "Site Priority Characterization" form (previously referred to as a "Priority Template" form) for each site. I have completed a first draft of this form for Safety Light Corporation and have attached it here:

(See attached file: PriorityTemplate-SafetyLightCorp.wpd)

Please review this form and provide me with any input. For descriptions of the "tiers" (noted near the beginning of the form), please refer to the following document. This document also contains some of the possible "additional factors" to be included under section #9.
